HCDE 536 Interaction Design and Prototyping

What is the problem area?

Front-desk interactions often break down when representatives struggle to understand **unfamiliar accents in real time**, leading to repeated clarifications and awkward exchanges.

This creates friction, slows down service, and affects both communication clarity and user confidence.

Introduction

Context

This study examines working as a **Desk Service Representative** at Lander Hall, focusing on helping students **retrieve packages** through identity checks, locating items, and real-time problem-solving.

Solution

Solution

The solution provides **real-time accent assistance** that transforms **speech into a more familiar** and understandable form as the conversation happens.

It also offers a **phonetic fallback** for unclear words, ensuring smooth, confident communication without

Solution

Design Requirement

Multi-modal experience for error fallback

When audio assistance is insufficient, the system should provide visual support (e.g., phonetic text). This ensures understanding through multiple channels, improving reliability.

Design Pattern

Bottom Sheet / Inline Overlay (phonetic assist layer)

Tradeoff: brief cognitive shift to visual mode.

Solution

Design Requirement

Edge case handling (fast speech, tone, environment sounds)

The system should remain effective under real-world variability like speed, noise, and tonal differences. This ensures robustness across diverse interaction scenarios.

Design Pattern

Adaptive Feedback + Progressive Disclosure (auto-suggest escalation)

Tradeoff: sudden UI escalation in edge cases may disrupt flow briefly.

Solution

Solution

Mood Board

The mood-board uses a **modern pop-art** style with **bold colors**, high contrast, and playful, expressive visuals.

It creates a dynamic, **engaging**, and **unconventional** design language that emphasizes clarity through strong visual elements.

ACC-SENT

An Adaptive Audio Assistant

Screens demonstrate the want to experiment with visual language while still grounding the design in the core interaction needs of real-time communication and clarity.
